KIKI Agent™

Autonomous LTV Campaign Execution Platform

Investor-Ready Pitch Deck

STOREGRILL INC LTD (Company No. 14581073) | 2026-10-17

The Problem

Ad platforms optimize to raw conversion value, not predicted lifetime value

A $149 order can represent ~$639 in 90-day LTV — platforms don’t see it

Fraud/IVT contaminates signals before optimization

Multi-platform complexity exceeds manual optimization

Privacy shifts drive need for first-party server-side enrichment

Why Now

Privacy changes → CAPI adoption is mandatory

Sub-100ms AI cost-effective at scale

Brands $50K+/mo need measurable ROAS/LTV alignment

Advantage+/PMax raise bar; cross-platform LTV control remains gap

First-party signal quality is strategic advantage

KIKI Solution (Code-Verified)

Next.js 15, JWT auth, 42 dashboard pages, 102 API routes — implemented

Groq (fast) + Azure OpenAI (mini/standard) with fallback

6 agents: bidding, creative, pacing, signals, syncbrain, oaas — DB-backed

Bidding: execution path implemented with approval gating + audit logging

Honest metrics: real DB data; fabricated deltas removed

Technical Architecture

UI: Next.js 15, React 18, Tailwind, KDLS dark theme

API: REST + SSE (tenant-scoped), JWT with ?token support for EventSource

AI: Groq Llama 3.1, Azure GPT-4o-mini/4o

Data: PostgreSQL (prod) + better-sqlite3 (local), tenant-isolated

Infra: Azure Bicep, Container Apps, Kafka; connectors OAuth/CAPI

Differentiation & Moat

LTV-enriched server-side signals change what algorithms learn

Cost-aware multi-model routing (SyncBrain) balances latency/cost/quality

Auditable agent actions + human approval for high-impact changes

Fraud blocked before enrichment (prevents model poisoning)

Revenue stacking: subscription + usage + OaaS + wallet/cards

Execution implemented; live verification against accounts pending

Market Opportunity (Bottom-Up)

Beachhead: eComm/lead-gen $50K–$2M/mo ad spend

Pricing: Starter $690/mo, Growth $2000/mo, Enterprise custom (implemented)

OaaS: 1.35% management fee + 5% ROAS uplift (implemented in billing)

TAM/SAM/SOM require validation — not over-claimed

Expansion: Enterprise, agencies, multi-brand

Traction & Validation (Truthful)

208 tests pass (18 files), type-check/lint clean

0 un-allowed stub findings (102 pages+routes scanned)

No verified paying customers/pilots/measured lift

3–5 design partners, 8–12 week pilots, holdout tests

Success: ≥10% ROAS lift (stat sig), ≥80% pilot→paid (hypothesis)

Security: critical findings verified remediated in current code

Go-To-Market

Beachhead: Shopify/WooCommerce brands $50K+/mo

Buyer: Head of Growth/CMO; Champion: Performance Marketing

Motion: Free trial → Pilot → Paid (annual)

Focus: measurable ROAS/LTV lift vs feature pitch

First 10–20 trusted customers critical

Founder-led + warm network + agency partnerships

Competition & Positioning

Signal/attr: Northbeam, Triple Whale, Rockerbox

Autonomous (integrated/free): Meta Advantage+, Google PMax

Objection "Why not Advantage+?" every sales cycle

Differentiator: cross-platform + LTV-optimized + auditable + multi-model

Single-platform optimizes own inventory; KIKI optimizes cross-platform LTV

Moat: trained LTV models + signal quality + auditability

Financial Model (Illustrative)

Revenue: subscription + usage + OaaS; aligns with implementation

AI cost managed via cost-aware routing; track $/enriched signal

Infra baseline ~$1400–$1800/mo (README); scales with usage

No verified historical revenue

5-year projections from company docs — internal inconsistencies flagged

Key: gross margin, CAC payback, inference cost, churn

Roadmap & Top Priority

#1 Fix bidding: push bids via updateAdSet (bidAmount), not updateCampaign (dailyBudget)

0–3m: fix correctness bug, connector tests, live verification

3–6m: 3–5 pilots with holdouts, capture measured lift

6–12m: pilot→paid, cost optimization, harden prod

12–24m: agency, enterprise, SOC 2 progress

Gate: pilot success criteria before scaling

Risks, Mitigations & Evidence Gaps

Trust: approvals + audit trail + least privilege

Bidding correctness: bid→dailyBudget bug — fix + verify live

Connectors: implemented, unverified live — 1–2 first + integration tests

Willingness-to-pay: unverified — paid pilots with success criteria

AI cost: $/signal tracking + cost-aware routing

Compliance: SOC 2 in progress; GDPR/CCPA documented

Investment Proposition & Close

Exists: working codebase (208 tests, clean checks), real DB flows

Prove: paid pilots with measured ROAS/LTV lift vs holdout

Ask (docs): Pre-Seed £350K (Q3 2026), Seed £1.5M (Q3 2027) — SEIS-eligible

Use: engineering (connectors+tests), pilots, GTM, infra

Runway: 12–18 months; ops@kiki.ai

Thesis: LTV-enriched server-side + cost-aware AI + auditable agents — credible if validated

Thank You

KIKI Agent™ — Autonomous LTV Campaign Execution Platform
